

# Photos of the SBach re-build, 3

When I last left the re-build I had formed the tunnel for the can. Going on from there:

Rear support bracket for the can made with silicon inserts:

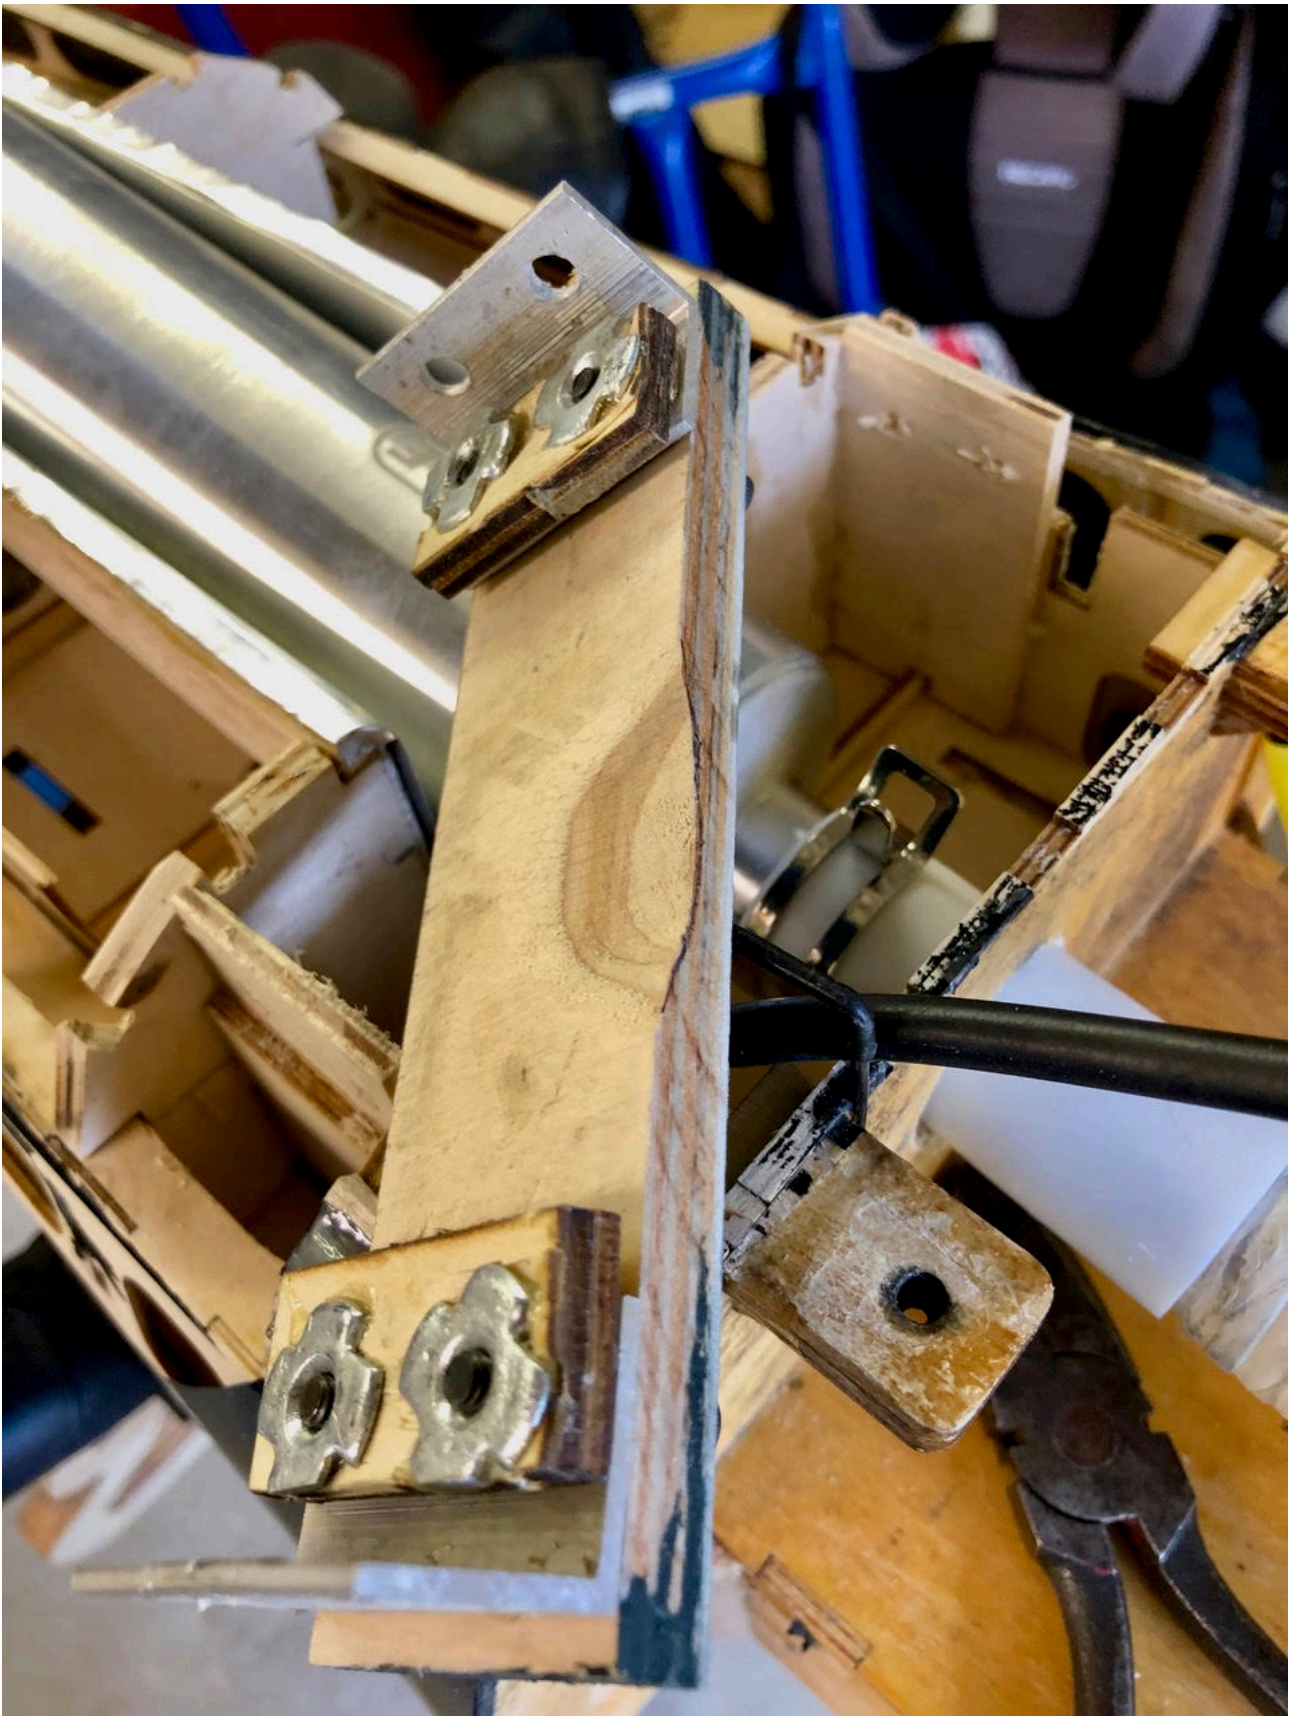

Mounting supports for the U/C:

U/C mounting plate scooped out for the canister:

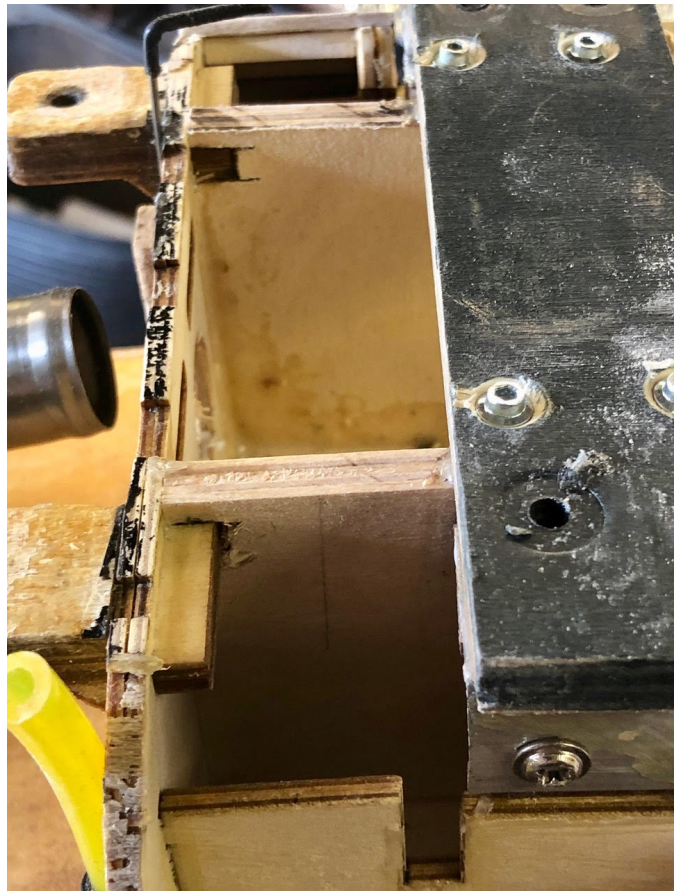

And temporarily fitted in place:

Next up, a couple of strengthening formers for the U/C which also provide some support for the firewall:

The crash took out quite a bit of the structure around the U/C, here you can just make out the end of a former which originally spanned the fuse and provided support for the outer skin:

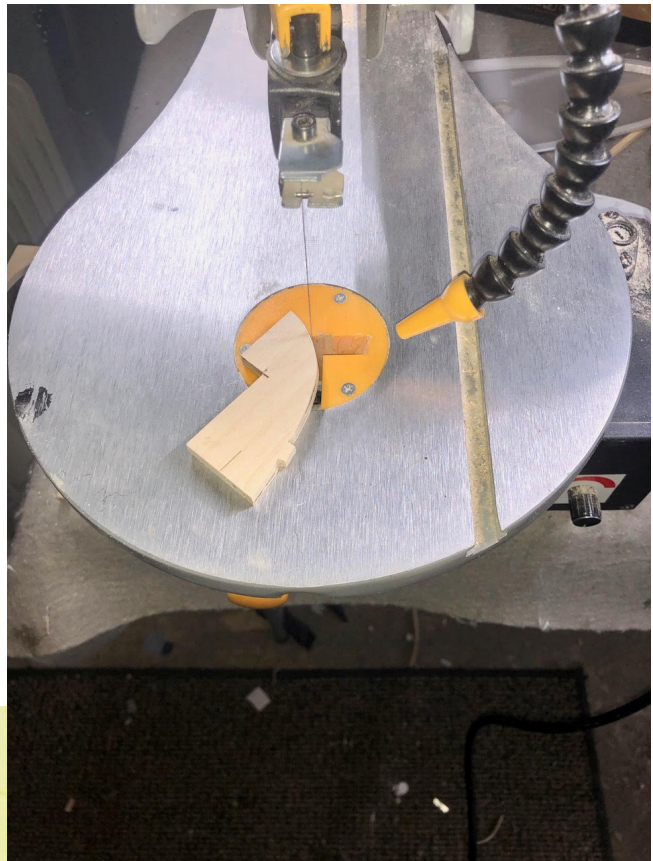

Not only was the centre part demolished, the other end was also destroyed leaving not a trace:

Out came the trusty scroll saw and  
a new piece made:

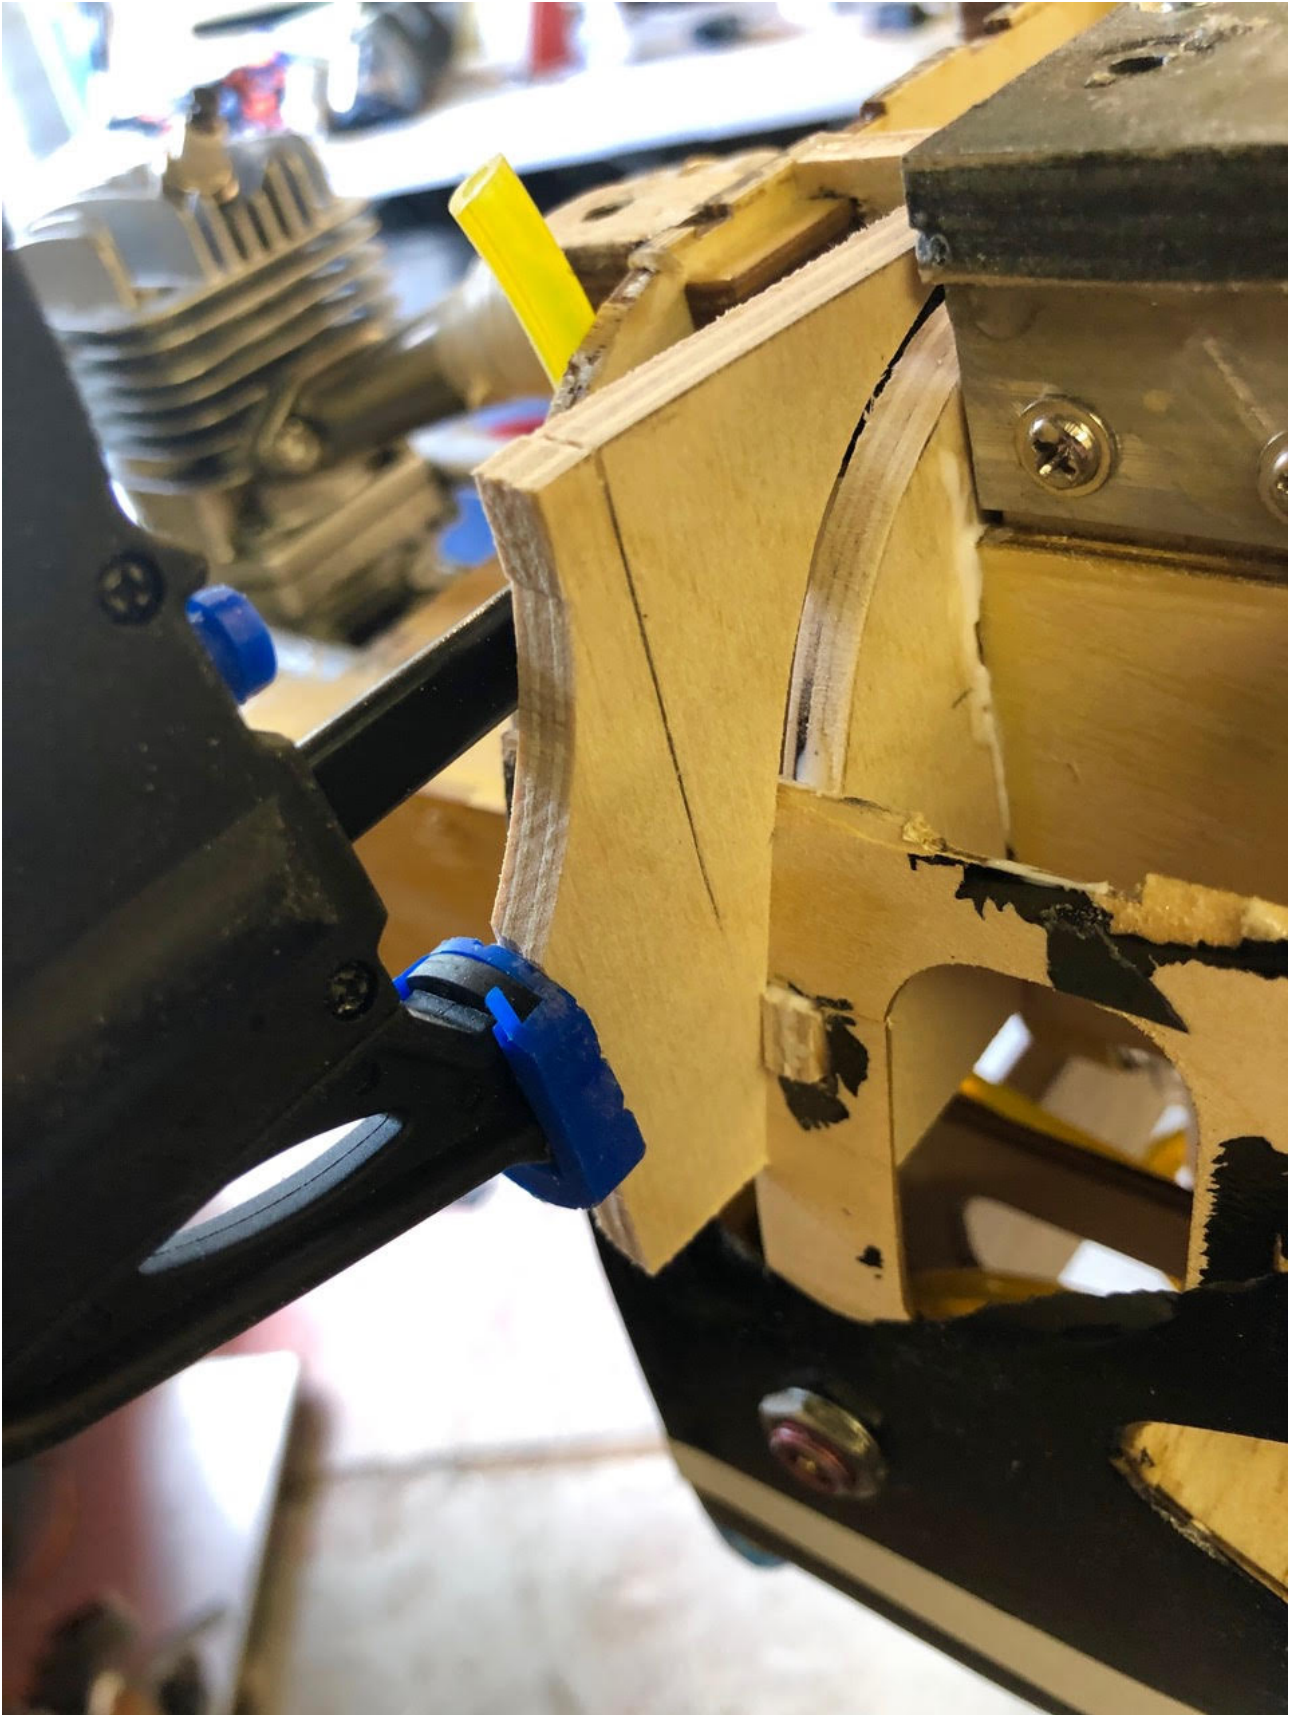

Fitted in place:

Using the offcut as a clamping former:

I also fitted some load spreader plates to the rear of the U/C former:

That completes the strengthening work around the U/C so it's onto the fitting of the longerons and balsa sheeting.
